3.3 # 18
$$y'' + 2y' + 6y = 0$$
, $y(0) = 2$, $y'(0) = x > 0$

(a) $e^{rt} \Rightarrow r^2 + 2r + 6 = 0 \Rightarrow r = -\frac{2\pm\sqrt{y-2y}}{2} = -1\pm\sqrt{y}$;

 $\Rightarrow y_1(t) = e^{-t}\cos(\sqrt{y}t)$, $y_2(t) = e^{-t}\sin(\sqrt{y}t)$

general solution: $y(t) = c_1e^{-t}\cos(\sqrt{y}t) + c_2e^{-t}\sin(\sqrt{y}t)$
 $y(0) = 2 \Rightarrow 2 = c_1$ (since $\cos(0) = 1$, $\sin(0) = 0$)

 $\Rightarrow y(t) = 2e^{-t}\cos(\sqrt{y}t) + c_2e^{-t}\sin(\sqrt{y}t)$
 $y'(t) = -2e^{-t}\cos(\sqrt{y}t) - 2\sqrt{y} = e^{-t}\sin(\sqrt{y}t)$
 $y'(0) = d \Rightarrow d = -2 + c_2\sqrt{y} \Rightarrow c_2 = \frac{d+2}{\sqrt{y}}$

Solution: $y(t) = e^{-t}(2\cos(\sqrt{y}t) + \frac{d+2}{\sqrt{y}}\sin(\sqrt{y}t))$

$$0 = \tilde{\epsilon}'(2\omega s(\sqrt{F}) + \frac{\lambda + 2}{\sqrt{F}} \sin(\sqrt{F}))$$

$$= 0 = 2\omega s (\sqrt{F}) + \frac{\sqrt{4}}{\sqrt{F}} sin(\sqrt{F})$$

$$= \frac{2}{\sqrt{F}} Sin(\sqrt{F}) = -2 cos(\sqrt{F})$$

=>
$$2+2 = (-2\sqrt{F})(\frac{\cos(\sqrt{F})}{\sin(\sqrt{F})}) = 3.50877...$$

$$O = e^{-t} \left(2\cos(\sqrt{r}t) + \frac{4t^2}{\sqrt{r}} \sin(\sqrt{r}t) \right)$$

$$\Rightarrow \frac{\sin(\sqrt{s} t)}{\cos(\sqrt{s} t)} = \frac{-2\sqrt{s}}{\sqrt{t^2}} \Rightarrow \tan(\sqrt{s} t) = \frac{-2\sqrt{s}}{\sqrt{t^2}}$$

Since 230, this says that ten(VFt) 50 => VFt is between { E and T (Smallest + for which y=0) so that $tan(NFt) = \frac{-2NF}{2+2} \Longrightarrow NFt = \pi - arctan(\frac{+2NF}{2+2})$

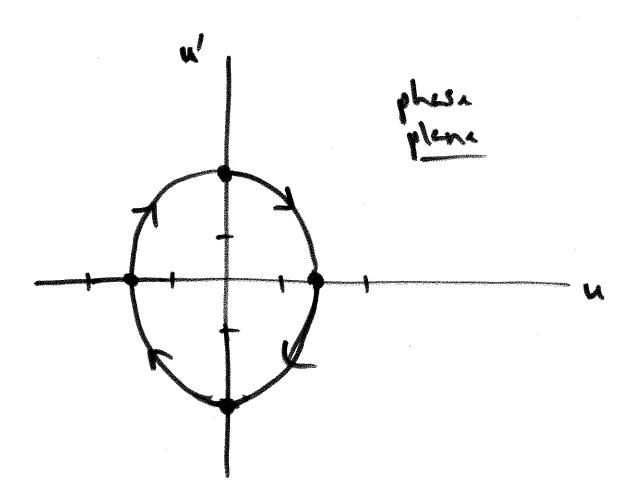

Since arctan(0) = 0.

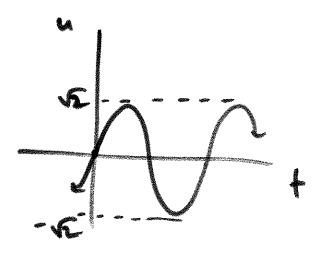

$$\frac{420}{20}$$
 u" + 2u = 0, u(0) = 0, u'(0) = 2

$$\Rightarrow$$
 $u(t) = \sqrt{2} \sin(\sqrt{2}t)$ $(u)^2 = 2 \sin(\sqrt{2}t)$ $u'(t) = 2 \cos(\sqrt{2}t)$ $(u)^2 = 4 \cos^2(\sqrt{2}t)$

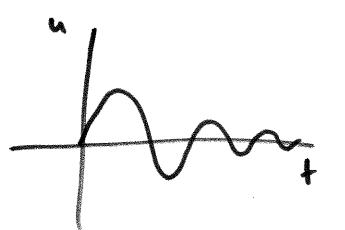

$$(u)^{2} = 2sin^{2}(\sqrt{c}t)$$

 $(u)^{2} = 4cos^{2}(\sqrt{c}t)$
 $= 2sin^{2}(\sqrt{c}t)$

$$\pm 21$$
 $u'' + \pm u' + 2u = 0$, $u(0) = 0$, $u'(0) = 2$

3.6 #1 y"- 5y' + 6y = 2et

step 1: Silve the homogeneous ODE, y'' - 5y' + 6y = 0 $\Rightarrow r^2 - 5r + 6 = 0 \implies r = 2,3$ $y(t) = c, e + c_2e^{3t}$

sty2: find a particular s.h.tun of the nonhomogeneous ODE, y"-ry'+6y = 2et
